

NAME: COLLINS AMADI
STUDENT ID: FWSD2511357
STUDENT EMAIL: fwsd2511357@students.icdfa.edu.ng
COURSE CODE: SBT-DF203
LAB NAME: HTTP ANALYSIS USING WIRESHARK: EMBEDDED IMAGE TRAFFIC
DATE: 09/09/2026
INSTRUCTOR: AMINU IDRIS

Scenario

Your practical context

Capture a plaintext HTTP webpage containing an embedded image, prove that the browser requested multiple objects, analyse TCP segmentation and reassembly, export the transferred image from the capture, and verify the recovered object against the original using SHA-256.

Objectives

What you must demonstrate

Explain browser-generated multiple HTTP requests; capture HTML and image transfers; analyse TCP reassembly; compare IP/TCP/HTTP size relationships; export HTTP objects; verify recovered-image integrity; explain cache and curl-versus-browser behaviour.

Instructor briefing

Laboratory guidance

SBT-DF203 — Basic Networking Skills for Digital Forensics

Lab 2 — HTTP Analysis Using Wireshark: Embedded Image Traffic

Official Lab Manual

Read the complete manual before starting. [Open the official SBT-DF203 Lab 2 manual.](#)

The manual contains the detailed commands, evidence worksheets, marking rubric, screenshot checklist, safety controls and report structure. The portal instructions below are the assessed workflow summary and do not replace the manual.

Required Practical Workflow

1. Read the official lab manual and prepare an authorised non-sensitive image.
2. Serve image.html and the image locally with Apache and hash the source objects.
3. Use a private/incognito browser window to minimise cache effects and capture the browser-generated HTTP traffic.
4. Identify the separate HTML and image GET requests and corresponding responses.
5. Analyse the TCP segments that form the image response and document the reassembly.
